# Sending ABB Totalflow Alarms to a Central Ignition Gateway

## Prerequisites

- Knowledge of Ignition and Module installation process: Cirrus Link Module Installation
  - Install the following MQTT Modules on two Ignition systems
    - Ignition System 1 (Central Ignition Gateway)
      - MQTT Distributor
        - MQTT Engine
        - MQTT Recorder
    - Ignition System 2 (Remote/Edge Ignition Gateway)
      - MQTT Transmission
      - EFM ABB Totalflow driver module

# Overview

The EFM ABB Totalflow module is capable of polling alarms from an ABB Totalflow device based on a specified polling rate. With MQTT Transmission, these alarms can be published as Sparkplug records to an MQTT server. Any client subscribed on Sparkplug RECORD messages can receive these objects. In addition, MQTT Engine when combined with MQTT Recorder can also receive these messages and store these objects in a configured Ignition database. The following drawing shows the general architecture used to do this. This tutorial outlines the process of getting alarms to the central Ignition gateway.

# Sending ABB Totalflow Alarms to a Central Ignition Gateway

We must configure a total of five Cirrus Link modules on two different Ignition gateways to get alarm data flowing from an ABB Totalflow device to a central database. These are:

- Central Ignition Gateway
  - MQTT Distributor
  - MQTT Engine
  - MQTT Recorder
- Remote/Edge Ignition Gateway
  - MQTT Transmission

EFM ABB Totalflow

The configuration of each of these modules is covered below based on the Ignition gateway they're installed on.

#### **Central Ignition Gateway Setup**

MQTT Distributor can be left in its default configuration. Note in a production system you would likely want to set up TLS especially if MQTT connections are using the Internet.

MQTT Engine can also be left in its default configuration.

MQTT Recorder requires that a database be set up in Ignition. That can be done as described in the 'Connect to a Database' section here. Once a database is set up, MQTT Recorder can be configured. Do so by opening the Ignition Gateway Web UI and browsing to the Configure tab at the top of the screen and then selecting 'MQTT Recorder Settings'.

Once there, select a Datasource as shown in the image below. This drop-down will be populated with any database connections set up in Ignition. Optionally, a Partition Period can be selected to segregated tables by time periods.

	<b>Q</b> Search				

At this point, the Central Ignition Gateway with MQTT Distributor, MQTT Engine, and MQTT Recorder is fully configured and ready to receive MQTT Sparkplug messages from the Remote/Edge Ignition Gateway. MQTT Distributor listens on TCP port 1883 by default for inbound MQTT connections. Make sure the Operating System's Firewall, Antivirus, and Malware protection services allow inbound connections on port 1883/TCP before proceeding.

### Remote/Edge Ignition Gateway Setup

With the Central Ignition Gateway ready to receive MQTT/Sparkplug RECORD objects, the EFM ABB Totalflow and MQTT Transmission modules can be configured on the Remote/Edge Ignition Gateway.

Start by configuring the MQTT Transmission module. Do so by opening Ignition Designer and creating a tag structure similar to what is shown below.

• • •		- Ignition-Mac	300k-Pro.local - Ignition Designer	
H H ← → 次 4 目 祝 1	11

► 💼 AGA7-1				
SUAGA3-2				
► 💼 SUAGA7-2				
				l v
	J			169 / 1024 mb
				169 / 1024 Mb

Note this structure is based on usage of the 'Default Transmitter' in MQTT Transmission. So, the directory structure is very important. Note the structure.

• tag provider/Edge Nodes/[Group ID]/[Edge Node ID]/[Device ID]/...

In the example below this implies the following definitions:

- [Group ID] = G1
- [Edge Node ID] = E1
- [Device ID] = Totalflow G4 Sim

These exact values will be used for the EFM ABB Totalflow connection Sparkplug parameters to tell the EFM ABB Totalflow which MQTT Transmission Transmitter configuration to use and, in turn, which MQTT connection to use to send the history data on.

Next the MQTT Transmission server configuration must be modified to point to the Central Ignition Gateway we set up earlier. To do so, in the Ignition Gateway Web UI browse to the Configure tab on the top and then to MQTT Transmission Settings in the lower left as shown below.

In the MQTT Transmission Settings configuration, click the Servers tab. Then click 'edit' on the Chariot SCADA MQTT Server definition. Modify the URL to match the URL of the Central Ignition Gateway. In this example, MQTT Distributor is installed on a Central Ignition Gateway at the IP address of 192.168.1.2. Once the URL is modified to match the configuration, there should be a '1 of 1' in the Connected column as shown below.

The next step is configuration the ABB Totalflow module. This is done as described in the ABB Totalflow Configuration manual. In going through the basic setup and configuration for Alarms configuration the following steps must be performed:

- Define the global Array-Registers definitions available for all ABB Totalflow devices in this Ignition instance.
   ° This step can be skipped if not configuring the driver to poll for AAR data.
- Upload the Periodic Mappings for all ABB Totalflow devices in this Ignition instance.
   This step can be skipped if default mapping provided by the driver is ok.
- Create the base device connection to the ABB Totalflow device.
  - Specify the subset of global Array-Register definitions that this specific ABB Totalflow device uses.
- This step can be skipped if not configuring the driver to poll for AAR data.
- Reconfigure device connection to enable polling for Alarms.

As en example, let's configure the driver to get Alarms and disable polling for Events and History. First of all, alarms can come from two sources:

- Alarm flags in Periodic History Records (Array 250)
- Alarm Log Record (i.e. Array 245)
  - The Alarm Log structure is returned from meters with the enhanced option turned on.

If the 'Alarm Source' device configuration option is set to PERIODIC\_HISTORY\_RECORDS, the scan rates can be set as shown below:

The first way is to set Periodic History scan rate as shown below:

- Alarm Scan Rate
  - Set to 0 to indicate that alarms are required.
- Event Scan Rate
  - Set to -1 to disable polling for Events.
  - If the 'Record Info Scan Rate' is set to -1, the 'Event Scan Rate' can be set to 0. With this setup, the EventPoller will not run on it own nor will it poll on notifications from the RecordInfoPoller.
- Periodic History Scan Rate
  - Set to a positive number to launch the PeriodicHistoryPoller with specified poll rate.
- Daily History Scan Rate
  - Set to -1 to disable polling for Daily History records.
  - If the 'Record Info Scan Rate' is set to -1, the 'Daily History Scan Rate' can be set to 0. With this setup, the DailyHistoryPoller will not run on it own nor will it poll on notifications from the RecordInfoPoller.
- Record Info Scan Rate
  - Set to -1 to disable the RecordInfoPoller so that there will be no notifications to Alarm, Events and History pollers on any 'RecordInfo' change such as 'Last Record Sequence number Used', etc.

At this point, the EFM ABB Totalflow driver is configured and is polling for Alarms at the rate specified in the EFM ABB Totalflow device configuration.

MQTT Transmission is connected to the MQTT Server and as a result MQTT Engine is receiving tag change events. In addition, because an EFM ABB Totalflow device has been created and configured with the same Sparkplug Group ID, Edge Node ID, and Device ID, history data will also be pushed to the MQTT server as Sparkplug RECORD objects. When new history data is polled by the EFM ABB Totalflow driver, they will be published to the MQTT server, consumed by MQTT Engine, passed on to MQTT Recorder, and then inserted into the specified database. Below is a view of some events records using a third party database viewing tool.
