MQTT Publishing via MQTT Engine

Prerequisites:

- Knowledge of Ignition and Module installation process: Cirrus Link Module Installation
- Install the following MQTT Modules
 - MQTT Distributor
 - v4.0.X if using Ignition 8.0.x
 - MQTT Engine
 - v4.0.X if using Ignition 8.0.x

Overview:

MQTT Engine provides a mechanism for publishing MQTT Messages from an Ignition script. This can be useful for general messaging outside of Sparkplug. For example, one may want to interface to another system that uses MQTT. This method allows arbitrary MQTT messages to be published based on events that exist in Ignition.

MQTT Message Publishing via Ignition Script:

Start by opening an Ignition Designer window and double clicking 'Scripting-> Gateway Event Scripts' from the Project Browser as shown below:

		Test - Ignition - Ignition Designer		
🗎 🕑 🔸	· → ☆ # # ₩ 11 11			
roject Browser		ت _ ×		
Q ∓ Filter		Project Properties 差	Scripting 🛄 Learn more

Now select 'Tag Change' click the '+' icon at the bottom of the window shown below and create a new Tag Change Script called 'Publish Script'.

Gateway Event Scripts	Gateway Tag Change Scripts	
Gateway Event Scripts Startup Update Shutdown Timer Tag Change Message	Tag change event scripts that run on the Gateway Publish Script Script Name Publish Script Change Triggers Value Quality Tag Path(s)	Enabled True estamp
	+ m	<u>Apply</u> <u>Cance</u>

Set the name of the script and then select a tag path. In this case we're using an MQTT Engine tag from an emulated device.

• •	Gateway Event Scripts		
Gateway Event Scripts	Gateway Tag Change Scripts Tag change event scripts that run on the Gateway		
Update Shutdown Timer Tag Change Message	Publish Script Script Name Publish Script Change Triggers Value Quality Tag Path(s) [MQTT Engine]Edge Nodes/Sparkplug B Devices/Java Edge Node/Emulated Device/Boolean]	Enabled	
	Ωκ	Apply <u>C</u> ancel	

Now select the 'Script' tab near the top. In it, type the following line:

system.cirruslink.engine.publish("Chariot SCADA", "a/b/c", str("hello world").encode(), 0, 0)

Note, the form of the publish method is as follows. You may need to change the method arguments based on your configuration:

system.cirruslink.engine.publish(String serverName, String mqttTopic, byte[] payload, int qos, boolean retain)

Where:

- serverName: The server name as shown in the MQTT Engine > Servers configuration

 Note: This is the Name and not the URL configuration parameter
- mgttTopic: The MQTT Topic to publish on
- payload: The MQTT payload
- qos: The MQTT quality of service to publish on
- retain: Whether or not to set the retain flag in the MQTT message

If your payload contains escape characters such as backslash you will need to use the 'r' modifier on your payload string to ensure these are included.

Example JSON payload:

```
payload = r{"metadata" : {"requiredState" : {"value_control" :"{\"pump_1\":{\"2\":\"off\",\"1\":\"
off\"},},}]"}","return" : {}}}
```

When complete, the script should look something like this. Now click OK.

	Gateway Event Scripts	
Gateway Event Scripts Startup Update	Gateway Tag Change Scripts Tag change event scripts that run on the Gateway	
Shutdown Timer Tag Change Message	Publish Script Tags Script Script Name Publish Script Change Triggers Value Quality Tag Path(s) system.cirruslink.engine.publish("Chariot SCADA", "a/b/c", str("hello world").encode(), 0, 0)	Enabled True
	+ =	
	ОК Арріу	<u>C</u> ancel

Finally, save and publish the project. At this point every time this tags value, quality, or timestamp changes it will result in a MQTT message being published on topic 'a/b/c' with a payload of 'hello world'.

Additional JSON examples:

payload=str('{"name":"John", "age":30, "car":"BMW"}').encode()

payload='{"myTestTag":"' + str(system.tag.read("[default]myTestTag").value) + '"}'
